

Tool for managing language files - Developer News

NEWS_PDF_AUTHOR: GIJOE

NEWS_PDF_DATE: 2003/10/20 17:12:49

"Xoops Language Checker" has just been released.
You can download it from <http://www.peak.ne.jp/xoops/>

Place 3 files included the archive into the same directory like /usr/local/bin.
Although 3 file is executable, you should run xoops_lang_check.php only.

I believe this tool must be useful for module developpers and translators.

eg)

For a module developer who maintains "mod_a" in mainly Spanish :

```
$ xoops_lang_check.php module/mod_a spanish english
```

This command shows you which constant definitions of english are insufficient.

```
$ xoops_lang_check.php --patch module/mod_a spanish
```

This command append constant definitions into appropriate files for all languages automatically.

For a translator who maintain "mod_a" from english to French :

```
$ xoops_lang_check.php --patch module/mod_a english french
```

After this command, you can easily found and edit the constants added new.

This tool is written in PHP CLI. Even if you don't have PHP CLI, converting to another type of PHP is easy, I think.
