Than take a closer look at TSW [The Saint WAMP] released this weekend at [localfoo:info](http://localfoo.info). This is a WAMP-Installer with all required features to run XOOPS (e.g. as a local copy of your live-page).

It is shipped with a two-instance apache2 (one for controlling the entire server). Support for several scripting- and programming-languages (php, perl, asp, ssi, python, ...) and two database-servers (mysql, firebird,...).

For further details visit [localfoo:info](http://localfoo.info)

Cheers!
