The Quran module for XOOPS 2 is officially released today for public download. This release was actually initiated by someone who had sent me an e-mail a few days ago, asked for the same module available for XOOPS as well. After some trials and errors, finally the module works under the XOOPS environment. I hope this module will be useful for all Islamic sites running on XOOPS out there. Just FYI, the module has been tested with XOOPS 2.0.6 only. I don't know whether it is also suitable for the earlier versions of XOOPS 2. Please try it by yourself, will you? :)

Enough said, you can download the module here or see the demo here.
