

RSSFit: Your composite RSS channel - Modules

NEWS\_PDF\_AUTHOR: tuff

NEWS\_PDF\_DATE: 2004/5/6 6:59:56

Distributing web content in RSS format becomes popular nowadays. [RSSFit](#) helps you to broadcast the latest updates of your XOOPS site by generating an RSS 2.0 validated XML feed, allowing your visitors to subscribe using an RSS reader software.

Unlike the official XML backend of XOOPS that works just for news, webmasters can decide what to be displayed in the XML output by activating installed plug-ins. RSSFit currently provides plug-ins for importing latest entries from the official modules: News, Newbb, myLinks, myDownloads and the popular unofficial module WF-Sections. Module developers can write a plug-in for RSSFit easily with the reference of the prepared plug-in example.

Reading an XML document with a web browser is quite draggy. RSSFit gives a better presentation when the XML output is rendered in modern browsers with the provided XML stylesheet.

**Other Features:**

RSS 2.0 validated Smarty template

Options to strip html tags and length of entries

Independent cache lifetime setting

Multi-byte languages compatible

[Download](#) or visit [RSSFit home page](#) for more information.
