## Catzwolf's modified evennews module bug-fix - Hacks

Posted by: tl

Posted on: : 2004/5/8 10:59:05

Catzwolf updated evennews with many new features.

- being able to specified sending email address instead of admin email
- move hard-coded subscription text/disclaimer into ModuleConfig database

There are several small bugs in it. I failed to get Catzwolf's attention, so I took upon myself and made a few of changes.

fixes

- 1) enabled MySQL database saving of HTML newsletters with apostrophes
- 2) specified sending system email address worked, in both creating and sending newsletters
- 3) fixed message archive viewing in admin (small typo corrected)
- 4) enabled dropping evennews\_members table when uninstalling (small typo in xoops\_version)

Only two files changed (admin/index.php and xoops\_versions.php): you can download from [here](#) Just replace the two files in Catzwolf's package.

Catzwolf's version can be found [here](#)

Still not working:

can't send to specified subscriber group of text or html. Newsletter will go to all subscribers, regardless of the group selected by subscriber when signing up. For now, I have taken out the choice in the sub template and I am sending newsletter strictly in HTML.

Newsletter count of failed and sent does not work.

Catz: I hope you (or someone) would continue to develop this module. This is a great module and it would be great if it could further developed.

Disclaimer:

The fixes are what I did to make it work for me and hopefully it will be useful to someone.

Cheers,

tl
