

NoAh - build it and they will come... :) - Modules

NEWS\_PDF\_AUTHOR: fatman

NEWS\_PDF\_DATE: 2004/6/14 6:18:33

With the growing interest in No-Ah, we've decided to put up a XOOPs site; first to facilitate new comers to learn more about No-Ah, and second to support the growing list of developers working with No-Ah.

Find it here: [No-Ah - What do you want to build today?](#)

No-Ah is a xoops module which turns your database into manageable content groups. It can be used to quickly model web based applications with just a few lines of php. Supported by the flexibility and object oriented design of the xoops portal system, No-Ah lets you define an architecture for managing your information and provides a template based interface to customize how you access it.

The complete php documentation of the No-Ah classes are here: [NoAh API Docs](#)

Quote:

"If one knows what kind of web application(content) one wants (i.e. what goes in/how or what goes out|how), one should be able to build it. Heck even at this stage I was able to hammer something together." - MrD

A great example of a No-Ah built application is a 'simple' but sophisticated Project/Task Manager, now in use at the site to help manage the No-Ah project. Note: this Noah app was built by a first time user of Noah (and a first time user of PHP as well).

[Sample Project Manager](#)

If you have questions about No-Ah, please use the forums at the site. And feel free to register for more access to the developer forums. The general help forum, and the download is publically accessible.
