

multiMenu 1.5 - sublinks now supported ! - Modules

NEWS_PDF_AUTHOR: solo71

NEWS_PDF_DATE: 2004/11/18 18:29:22

The [WolfFactory](#) is proud to announce the release of [MultiMenu 1.5](#). This new version encompasses some interesting and very expected modifications :

- Pictures now support relatives links (alike links)
- Dynamic sublinks are now supported (Yay !)

Many thanks to Do Huynh Ngoc Huy from [aitvna](#), who made that wonderfull and very expected modification ! I have included (and adapted) his modification to the original multiMenu. Pay attention : sublinks work only if you use the same directory as the main link ! Exemple : Main link -> modules/news/ Sublink -> modules/news/submit.php (will show up) Sublink -> modules/mydownloads/ (won't show up) This version is not compatible with previous version of multiMenu (due to new data base entry). Please uninstall previous version before installing this one... Enjoy !
