

WebMailFX road to 1.0RC2 - Modules

NEWS\_PDF\_AUTHOR: flyingtux

NEWS\_PDF\_DATE: 2004/11/19 17:42:23

The WebMailFX Team is currently carrying on a huge amount of code changes.

In progress:

- moving "config options" from /cache/config.php and config2.php to xoops\_version.php: this will significantly enhance module security and improve its respect of xoops standards;
- new POP3 class: this will solve many problems people have been having such as international charsets, the STAT problem ( +(ok) ), etc...

Already done:

- case sensitivity in CPanel;
- background colors controlled through vars in a file;
- turn settings off controlled through group permission.

Investigation on:

- increasing server security by forcing the module to delete attachments from it.

Scheduled for latter versions:

- starting translations projects: it could be done after "config options" will be completely migrated to xoops\_config.php;
- register\_global issue, which will require a lot of code rewriting;
- IMAP implementation.

We would like to thank all the people around the world which gave us feedback and encourage everybody to participate to the project.
