

phpBB Port Released (BETA) - Modules

NEWS_PDF_AUTHOR: intel352

NEWS_PDF_DATE: 2004/12/1 7:16:38

This release is a **working** port of phpBB 2.0.9, functioning without the need for any Xoops core modifications.

This is based on BBPixel.com's v1.22 port of phpBB 2.0.9.

It took me about a day to get the module working initially, and about 4 days of refinement of the code, making sure that both members and anonymous users alike could use the module.

MOST of the focus has been placed on the frontend of the module. While I briefly checked all areas (frontend and Admin) to see if they functioned, I have not thoroughly tested the module. This is why **YOU** are being allowed to download this early release, to help me bugtest the module.

[GET IT HERE](#)

Known issues:

- Administration system breaks out of the 2-pane view when you navigate away from the index admin page
 - After installation, initial visit to the module installation is met with a blank page. The module is updating the database configuration, this will only occur in **THIS** release, and will be fixed before the next release. Refresh the page to see the module.
-

Next Release:

- Next release will focus on transforming the phpBB administration system into a typical XOOPS administrative environment.
 - The template/theme system will be modified to work **better** within xoops. (To allow the module to display it's own phpbb templates without the phpbb css file taking over the xoops theme appearance as well)
-

NOTE: THIS IS A BETA RELEASE, USE AT YOUR OWN RISK. THIS MODULE SHOULD (theoretically) FUNCTION ALONGSIDE 'pbboard' FROM BBPIXEL WITH NO PROBLEM.

The purpose of this project, is to create a port of the phpBB module that works **without** and Core Xoops file hacks or modifications. The **only** area of xoops core that is now affected by this module, is a new member is added to the user database (Anonymous, uid=0).
