

xWhois for XOOPS 2 - Modules

NEWS\_PDF\_AUTHOR: seventhseal

NEWS\_PDF\_DATE: 2005/1/4 7:43:32

I have just finished a small mod and block combo that allows you to add Whois search capabilities to your site. You can check it in action at [VelocityWebHost.com](http://VelocityWebHost.com). As usual, anyone who would like to send translations files - credit will be given and I will gladly accept! Read on for install details!

### xWhois v1.0

This is a simple mod and block combo that allows you to add Whois search capabilities to your site.

There are 2 types of blocks with html templates. The first block looks best as a side, the second block looks best as a center. Choose the style you like!

### Installation

Copy the package to your Xoops modules directory and install as any other module. There are no databases.

This is a very simple module and block php code section.

### Credits

sloppycode.com created the class file used to interrogate the internic database. There were some minor modifications to get it to work under XOOPS, but credit goes where credit is due. Don't even know if this site is still around.

The rest is © copyright XOOPS @ IBDeeming! Post comments or suggestions at [XOOPS@IBDeeming!](mailto:XOOPS@IBDeeming!)
