

Pictureurl V1 is out - Modules

NEWS\_PDF\_AUTHOR: philou

NEWS\_PDF\_DATE: 2005/5/25 20:50:00

This very simple module allow to display a different picture to each page of your XOOPS website.

It adds 2 new smarty variables, including possibly a display style for the picture.

#### Administration

This module does not have any menu or block.

Start by uploading your pictures with admin interface, or directly by ftp in uploads/pictureurl directory of your website.

The form 'create a picture' allows to associate a picture to a page (url) of your site.

you can use 2 new smarty vars, one classic div and one with css attributes

[Download the module Pictureurl](#)

Thanks to [Christian](#) for the doc page

Installation At the module installation, a picture storage directory will be created automatically (uploads/pictureurl). To use the smarty variable, you must modify the file header.php, at your website root. You must paste the following code just before the line // Weird, but need extra

tags for 2.0.x themes , for example. // module pictureurl Philou include\_once

```
XOOPS_ROOT_PATH.'/modules/pictureurl/include/function.php';
```

```
$xoopsTpl->assign('xoops_pictureurl', xoops_getpictureurl());
```

```
$xoopsTpl->assign('xoops_pictureurlcss', xoops_getpictureurlcss()); // end pictureurl Philou
```

Smarty variables integration in your theme or template Edit the file theme.html for example and insert or at the place where your picture must be displayed. Don't forget to answer yes in admin system, preferences, general parameters, Theme, files update by themes/ directory in order to validate your modification.
