

kig = install.php generator - Modules

NEWS_PDF_AUTHOR: kyex

NEWS_PDF_DATE: 2002/5/26 14:10:40

kyex install.php generator is a module made to help developer to create "easy to install" modules 😊

This admin module help you to create an install.php file for your modules. Originally I wrote an install.php file for my TV module, and I modify it for my next module. But I didn't want to modify the same install.php each time I wrote a module. So, I wrote kig and used it for my webring module.

Characteristics of generated install.php:

- create tables
- insert values in tables
- use \$xoopsDB->prefix
- multi languages

You can download this module [here](#).

This is the first public release of kig, so any comment is welcome, thanks. And help is needed to make good language files 😊
