

Marquee version 2.0 Alpha 1 - Modules

NEWS_PDF_AUTHOR: hervet

NEWS_PDF_DATE: 2005/12/20 18:30:15

The Xoops Marque module was released in version 2.0 Alpha 1.

Alpha means that all the module's fonctionnalités are not finished and that you don't have to use it on a production site. The code and the fonctionnalités in the next versions will change.

Marquee is a module wich enable you to give "weight" to some information by placing it in a scrolling block whose content will scroll horizontally or vertically.

The great enhancement of this version it's the possibility to extract content from other modules.

On the form of *plugins* (in fact Php scripts), you can, for this moment, extract content from the News module, from the Xoops comments, from the Newbb module (version 1 & 2), from Mylinks, from Mydownloads and from xoopspoll.

Some plugins for other modules (like catAds for example) will be soon available.

In the new fonctionnalités, you can note :

- the possibility to use kiovi
- the module detects spider robots to present them a content they can read
- you can use on the fly blocks. It means that you can create as many blocks as you want.
- when you select to use a module's content, you can select the number of elements to return and the titles length.

The definitive version will enable you to use the (non standard) html tag *marquee* wich is already used or a javascript version to be compatible with more browsers. This is not already made but I'm working on it.

[You can download the module here](#)

Please note, I recommend you to uninstall any older version, if you want to test this new one, before to install this.

Module is available in french, english, german and chinese.

bye,
Hervé
