XBS Logger (App logging for Xoops) - Modules

NEWS_PDF_AUTHOR: chippyash

NEWS_PDF_DATE: 2006/3/31 11:39:09

V1 Release Candidate 1
XBS Logger is a Xoops module that implements an application logging capability for other Xoops modules. In common with many XBS modules, it is not meant to be used by itself but provides generic capabilities that many applications can use. The module does provide an administrative interface so that you can see and delete log entries. This means the developer does not need to do this themself. A relatively simple set of configuration options are also provided.

Prerequisites

Xoops >= V2.0.13
Xoops V2.2 will work although you may experience some weirdness in the display of the admin menus etc.

PHP >= 4.3.10. Versions prior to this do not support the %F attribute to sprintf() and therefore logs cannot be read from disk into database and therefore are not displayed.
