

Fpdf for xoops and other CMS - Modules

NEWS_PDF_AUTHOR: ekke

NEWS_PDF_DATE: 2002/7/26 15:18:35

PHP OS independent Pdf System for Xoops (<https://xoops.org>). Based on fpdf (<http://www.fpdf.org>). No need of pdflib.

Current State: Ready for the first Module (News).
We take the Content from the Database to make the Page.

Live example:

The Story (in german):

<http://www.audimaxx.net/modules/news/article.php?storyid=10>

Click on the Pdf-Symbol or here:

<http://www.audimaxx.net/modules/news/printpdf.php?storyid=10>

Idea behind:

Fpdf only on one Place and only one printpdf in the Modules Folder.

Where? <http://sourceforge.net/projects/pdf4cms/> unzip the package in your xoopsroot. go to modules/news and change article2.php in article.php (there is only one link added) the important file ist printpdf.php Help: On <http://sourceforge.net/projects/pdf4cms/> one english, one german. Outview: 1. Grab the imageURL from the Database und put it in. Problems: a)only jpg and png, b)the imagesize in pixel, we need mm und there is a difference between Monitorlook and Printversion because of the resolution (Monitor 75dpi, Print 150-300dpi) c) the absolute place in document. Text and imageplace is counted. 2. after that, to put it in all modules. 3. admin Template System. *This looks like a nice mod!*
