Vdrag (based on "Mor.Pho.GEN.e.sis") is a "variation" of Vart, but limited to 980px in width and it does not have a banner.

This theme with the characteristic to use a drag and drop system (to slip, deposit) for its blocks... Each page can be differently laid out and the positioning recorded in a cookie.

[Download & Demo](#)

Envy to make of Drag and Drop with your themes

The site "<http://www.dhtmlgoodies.com>" proposes a simple script to us: you should call just a file "js" in theme.html (will find it to you in file "JS" of the archive, he is appointed draggable-content.js) with the top of between et .

```
var rememberPositionedInCookie = true;  
var rememberPosition_cookieName = 'draggable';
```

Then you must create a new which surrounds each block which must move.
Example for the elements "content" :

For the block of left and right to amend blockzone.html like those :

Then correctly to dimension your blocks, you ensure to have yourselves will find at the end of block.css

of our theme the sizes to be informed imperatively.

```
/* block central top and bottom */
#xo-page-topleftblocks .xo-block, #xo-page-toprightblocks .xo-block, #xo-page-bottomleftblocks .xo-
block, #xo-page-bottomrightblocks .xo-block {
width: 280px;
}
/*block central */
#xo-page-topcenterblocks .xo-block, #xo-page-bottomcenterblocks .xo-block {
width: 600px;
}
/* block right */
#xo-canvas-rightcolumn .xo-block {
width: 170px;
}
/* block left */
#xo-canvas-leftcolumn .xo-block {
width: 190px;
}
```

Here are the blocks are “draggable” and they are recorded in the cookie on the computer of the visitor, all the pages can be differently personalised.
Thank you Kris_fr for the debug.
