After trying multiple CMS, the owner of <a href="http://www.republicanreformparty.org">http://www.republicanreformparty.org</a>, asked me to build his website with any CMS that would provide his Website with an elegant look and an easy interface

I was so sure that only XOOPS can do it, and now the website is based on XOOPS scripts!

## the modules used are:

- wfchannel 1.07
- xcgal 2.04
- contact
- news
- tellafriend
- rased : a module to show visitors by state, i translate it from arabic into english, the original module is developed by arabxoops)

The theme is the default one with some modifications, I use the red because it's one from our Lebanese flag, and the owner is an ex presidential candidate, so the website is a political one more than a personal one

Any comments or suggestions are most welcome
