NEWS_PDF_DATE: 2008/12/7 7:40:00

The long-awaited updated release of Wiwimod 0.8.3 has arrived and is released as SimplyWiki 1.0 Final.

This module is a native wiki for XOOPS-based sites, offering wiki simplicity with support for WYSIWYG editors. The focus of this release was to make the module easier to use in a variety of XOOPS sites, more stable and more secure -

- * All date formats are drawn from language//global.php, keeping date formats consistent with the rest of your site
- * All text has been converted to language constants, eliminating hard-coded messages and making translation easier
- * The blocksadmin area has been updated to work with current versions of XOOPS
- * The module's directory can be renamed to any acceptable directory name
- * Support for right-to-left languages is built in

Read the changelog included in the download packages for more details.

Installing/Updating

- * Download and unpack the module
- * Upload the wiwimod folder to your modules folder (overwriting existing files, if Wiwimod was previously installed)
- * Go to the module administration area and install the module, or update the module, if previously installed
- * Enjoy!

What the Future Holds

More is in store for the future of SimplyWiki - work has already started to improve the database structure, increasing performance and flexibility. More options for blocks will also be added - most viewed, oldest/newest pages, shortest/longest pages, pages by the same author, sibling pages (pages with the same parent) and child pages are just some of the features already being worked on.
