For those who attempted to use the Video Tube v1.81 release and experienced problems, we have now corrected the bugs that were introduced in this release. Many of you experienced blank page displays. This was due to the use of XoopsTree class within the module that caused conflicts. This issue has now been resolved. There were also some category bugs that prevented edits to videos from working properly. These issues have been resolved as well.

This update does introduce one more new feature. Positioning of the Video Preview on search result screens now appears near the video thumbnail whenever a thumbnail is selected. This was accomplished by capturing the mouse pointer coordinates when a thumbnail is clicked, then using these coordinates for positioning of the Video Preview. This new feature has been verified in both MSIE and FireFox, as FireFox handles events differently than IE.
