
Image Resizer module rewritten - Modules

Posted by: Runeher

We needed an enhanced version of the image resizer module for a website to get a uniform width of submitted images etc...

The 'Image Resizer module' will automatically convert any image submitted to a fixed width and to a fixed resolution (default is 90).

This will speed up the image conversion process and the loss of image resolution should be minimised.

All images will be converted to jpg format, and you can easily delete all images from the admin menu.

There is an option to create thumbnail/avatars (More information can be found within the module help).

Language files: English, Norwegian, Danish, Swedish.

[Demo and download](#)

Tanks to [anderssk](#) for Danish translation and to [Catzwolf](#) for English correction 😊 and for fixing a bug! *
