TDM is happy to share with you TDMCreate 1.1, module to create XOOPS modules.

What's new in this version:

- Additional elements in the forms:

- \* TextArea
- \* Color Picker (mimetypes and size can be changed in the preferences for each field)
- \* Image Upload (mimetypes and size can be changed in the preferences for each field)
- \* a new field: Select , to retrieve data from another table of the module, you need to indicate or to fix the main fields in the table.

- Adding a system to determine which fields will be searched in a global search in Xoops (valid for a table)

- Adding a system of required fields in forms

- Add comments (valid for a table)

Fixed some bugs, I can not remove the bug "ï»¿" I encoded with UTF8 without BOM, but it changes nothing 😞

This module was tested with Xoops 2.3.3, I advise you to uninstall the previous version and then reinstall this version.

I put in the language files, additions in English, if I get translations, they will be added as and when.
