Today I've completed my first XOOPS module.

The module is supposed to represent on page Bilib videos from Youtube in flash format:

You can similarly integrate it with some embed code, as used by YouTube
or you can use SWFObject

There are 3 variables

- Playlist = place the name of an XML playlist
- autoplay = true or false
- rollover_changing_thumbs = true or false (if the thumbnails to change on roll over)

XML structure:

As you can see, the XML structure very simple

Whenever you want a new YouTube video,

you just need a node named

"Title", a node named "ID" and a node named "Description"

You have here an example:

YOUTUBE_ID

Description (supports HTML text with CDATA)

All in mylist.xml

so it could show videos to your site when they want and how they want ... 😊
