Hi,

there are some webmasters still using XOOPS 2.2 even though XOOPS 2.4.5 has been released. And this is because of something that is only in XOOPS 2.2: **Displayname**.

So I've created this hack which will let you add Displayname to your website.

This hack support english and persian languages and was tested on XOOPS 2.4.

Here is a [direct download link](#) from the Persian XOOPS support site.

Just extract it into the Root of your XOOPS Installation and go to this address :
yourwebsite/SyncLN.php

After updating your profile module you'll have a Displayname in your site.

I hope this will help.
