TwitterBomb 1.14 RC

Twitter Bomb allows you to place segments of a tweet into a database, and aggregate via services like twitterfeed.com tweets based on a sentence formed from a matrix of basis of sentences. You will be able to run a campaign on twitter and have your sentences randomly made from the segments of sentences known in this applicaion as the 'base' of the phrase.

Since this version there is also now two type of campaigns you can run, either a phrase bombing, or a scheduled tweet. You can import a list from a text file or log file, where each line is periodically tweeted on twitter as per your schedule. Including tabled filters for easy use and maintence as well as harvesting plugins that allow you to develop with TwitterBomb to retireve information from other sources like API, databases, text files, SOAP ports or many other places like modules on your website.

TwitterBomb 1.14 is the new Release Candidate, we don't expect to be doing anymore releases of this application as it is full of features and has all the nessecary details for expansion with plugins.

There is a mirade of options with this application. You can specify URLS to pass someone too included in the URL can be the phrase in a URL Encoded string so you can direct people to search engines and topics to do with the sentence.

Check out TwitterBomb in action YouTube with this How To Instruction Video:
