Dear users of Xoops.

I want to share eforms, a module to create contact forms, registration, surveys, etc.. I've developed as a fork of xforms.

Some of the functions including:

- Ability to record data in DB.
- Sending email (copied configurable) and private message
- Management of attached files and images (including downloaded)
- Multiple configurations form (descriptions, shipping methods, etc.).
- Generation of reports for saved forms
- Set start and end dates of validity
- Etc. ..

You can download it from here: [eforms](#)
