

## Roster - Modules

NEWS\_PDF\_AUTHOR: BassPlayer

NEWS\_PDF\_DATE: 2003/3/13 1:20:27

Sup all,

After not finding any good opensource game roster applications, I decided to write my own. Three or four weeks later, I've lost count, I'm pretty much done. I now have a php database app that tracks pilots, pilot info, awards, ranks, units, and access rights.

The [Roster Page](#) shows a listing of all pilots, their rank, unit, a link to their own awards page, a link to their own bio page, statistics and other stuff.

The [Commands Page](#) shows a hierarchal command structure in sort of a tree fashion with unit commanders and pilots listed.

It's all maintained via a [Administration Backend](#) where you can update all the info.

If you want to check it out, the demo username is Demo and the password is demo.

I tried to make it open ended so any group could use it. The app is written in php and requires a web server (preferably apache) and mySQL. While this is not a Xoops module I have included some configuration items to enable it to be wrapped with freecontent. Wrapped versions of the above links can be found at the [Outworlds Alliance](#) website. Look for the Unit Info block.

If you are interested in running it drop me a line. If you like it/think it sucks/whatever drop me a line.

BP
