Hey everyone,

I just modularized the latest version (0.18.0a4) of the Mantis Bug Tracker for use in Xoops 2. This module is for setting up a bug/feature/etc tracker at your site. Available in the downloads section.

I've included a file README_XOOPS with installation instructions (you can do a fresh install, or move a previous installation of mantis to xoops).

If you have any problems, please post on modules forum here. Do not contact the Mantis team - I am not affiliated with them in any way. Thanks.

Enjoy!
