I've just finish fist beta from my module - C-HTML for include html pages into xoops theme.

It's very simple to work:

just download your html into ../modules/c-html/ directory & go to yourdomain/modules/c-html/?your.html (very nice url - only in my module 🤖)

You may create sub-directory.

That's all! 😊

You may download it from my site - xoops2.ru
