I just finished my work on version 1.3 of TinyContent for Xoops 2.0.x. TinyContent is a simple content module, where you can create content with the xoops built-in editor. Also you can add html files with the PageWrap function.

- * added comments feature
- * comments can be activated/deactivated for every article
- * enhanced the PageWrap feature
(upload/delete files through administration)
- * fixed minor bugs

For the ability to turn on/off comments on every article, I had to change the database a little. So current v1.2 users can't simply overwrite the existing files. There is also no update script at the moment, sorry.

If anybody translates this module into another language please contact me or send me the language files. I would be happy to include it into the package.
